RocketMQ在Windows平台下环境搭建

一。环境搭建

需要jdk1.6(以上) 64bit, maven, eclipse

二. RocketMQ项目下载

项目地址: https://github.com/alibaba/RocketMQ, 将下载的RocketMQ-master放到eclipse工作空间中

三. 将RocketMQ-master导入到eclipse中

1. 将项目导入eclipse,如下图

```
▲ PocketMQ

 ▶ BocketMQ-master
 Procketmq-broker
 ▶ " rocketmq-client
    🚽 rocketmq-common
 ▶ " rocketmq-filtersrv
                                         Cor
 ▶ № rocketmq-namesrv
 ▶ " rocketmq-remoting
 17
 17
 17
```

2. 在我下载的RocketMQ-master的pom.xml文件的parent有个问题,默认如下:

```
2.
         <groupId>com.taobao
3.
         <artifactId>parent</artifactId>
 4.
          <version>1.0.2
     </parent>
5.
6.
7.
      <!-- <parent>
8.
         <groupId>org.sonatype.oss</groupId>
9.
         <artifactId>oss-parent</artifactId>
10.
         <version>7</version>
     </parent> -->
11.
```

但是编译时总报错parent找不到,而用下面的parent,则编译通过。

```
1.
     <!--<parent>
2.
         <groupId>com.taobao
         <artifactId>parent</artifactId>
4.
         <version>1.0.2
5.
     </parent>-->
7.
     <parent>
8.
         <groupId>org.sonatvpe.oss</groupId>
9.
         <artifactId>oss-parent</artifactId>
10.
         <version>7</version>
11. </parent>
```

3. 由于我用的是jdk1.7,故修改RocketMQ-master.pom的jdk版本

    10. <file_encoding>UTF-8</file_encoding>
    11.
```

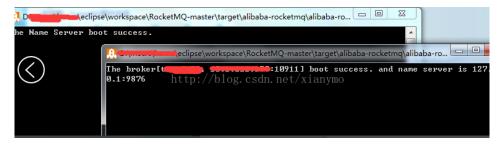

四. 编译RocketMQ项目

1. 在命令行执行在RocketMQ-master文件夹下的install.bat批处理

```
):\http://blog.csdn.net/xianymo
```

- 2. 该命令会编译整个项目,并在RocketMQ-master目录下生成一个target文件夹
- 3. 进入刚生成的target文件夹下的bin目录,在命令行中执行: start mqnamesrv.exe,会弹出一个信息窗口,显示The name Server boot success 说明启动成功了,接着启动borker,在命令行中执行: start mqbroker.exe -n 127.0.0.1:9876 同样的弹出一个窗口,看到 success表示成功了。

```
D: \______eclipse\workspace\RocketMQ-master\target\alibaba-rocketmq\alibaba-rocketmq\alibaba-rocketmq\alibaba-rocketmq\blog.csdn.net/xianymo
D: \___eclipse\workspace\RocketMQ-master\target\alibaba-rocketmq\alibaba-rocketmq\alibaba-rocketmq\bin>start mqbroker.exe -n 127.0.0.1:9876
```

五. 启动Producer和Customer

1. $m ext{cRocketMQ-example}$ 项目中加入Producer.java

```
1.
     public class Producer {
2.
         public static void main(String[] args) throws MQClientException,
 3.
         InterruptedException{
 4.
        * 一个应用创建一个Producer,由应用来维护此对象,可以设置为全局对象或者单例<br/>
<br/>
obr>
 5.
 6.
        * 注意: ProducerGroupName需要由应用来保证唯一<br>
        * ProducerGroup这个概念发送普通的消息时,作用不大,但是发送分布式事务消息时,比较关键,
 7.
        * 因为服务器会回查这个Group下的任意一个Producer
 8.
9.
       final DefaultMQProducer producer = new DefaultMQProducer("ProducerGroupName");
10.
       producer.setNamesrvAddr("127.0.0.1:9876");
11.
12.
       producer.setInstanceName("Producer");
13.
14.
        * Producer对象在使用之前必须要调用start初始化、初始化一次即可chr>
15.
        * 注意: 切记不可以在每次发送消息时,都调用start方法
16.
17.
18.
       producer.start();
19.
20.
        * 下面这段代码表明一个Producer对象可以发送多个topic,多个tag的消息。
21.
22.
        * 注意: send方法是同步调用,只要不抛异常就标识成功。但是发送成功也可会有多种状态,<br>
23.
        * 例如消息写入Master成功,但是Slave不成功,这种情况消息属于成功,但是对于个别应用如果对消息可靠性要求极
        * 需要对这种情况做处理。另外,消息可能会存在发送失败的情况,失败重试由应用来处理。
24.
25.
26.
       for (int i = 0; i < 10; i++){</pre>
27.
         try {
28.
29.
               Message msg = new Message("TopicTest1",// topic
30.
                    "TagA",// tag
31.
                    "OrderID001",// key
                    ("Hello MetaQA").getBytes());// body
```

```

1. Re:RocketMQ在Windows平台下环境搭建

执行完编译之后没有.exe文件阿,请楼主解 答

--灵魂盗猎者

2. Re:RocketMQ入门(1)

很不错的文章, 赞一个!

--灵魂盗猎者

3. Re:RocketMQ在Windows平台下环境搭建

请问在进入刚生成的target文件夹下的bin目录,在命令行中执行: start mqnamesrv.ex e,会弹出一个信息窗口这一步中 bin目录下并没有mqnamesrv.exe 只有mqnames.....

--小野人~kobe

4. Re:RocketMQ在Windows平台下环境搭建

你好,运行start mqnamesrv时出现window s版本不兼容怎么办?我的是win7 64位。

2. RocketMQ入门(1)(1)

```
33.
                  SendResult sendResult = producer.send(msg);
34.
                  System.out.println(sendResult);
35.
36.
37.
              {
38.
                  Message msg = new Message("TopicTest2",// topic
39.
                        "TagB",// tag
                        "OrderID0034",// key
40.
41.
                        ("Hello MetaQB").getBytes());// body
42.
                  SendResult sendResult = producer.send(msg);
43.
                  System.out.println(sendResult);
44.
45.
46.
              {
                  Message msg = new Message("TopicTest3",// topic
47.
48.
                        "TagC",// tag
                        "OrderID061",// key
49.
                        ("Hello MetaQC").getBytes());// body
50.
51.
                  SendResult sendResult = producer.send(msg);
                  System.out.println(sendResult);
52.
53.
54.
           }catch(Exception e) {
              e.printStackTrace();
55.
56.
57.
           TimeUnit.MILLISECONDS.sleep(1000);
58.
59.
60.
         * 应用退出时,要调用shutdown来清理资源,关闭网络连接,从MetaQ服务器上注销自己
61.
         * 注意: 我们建议应用在JBOSS、Tomcat等容器的退出钩子里调用shutdown方法
62.
63.
64.
      //producer.shutdown();
        Runtime.getRuntime().addShutdownHook(new Thread(new Runnable() {
65.
66.
           public void run() {
67.
              producer.shutdown();
68.
69.
        }));
70.
        System.exit(0);
71.
      }
72.
     }
```

2. 加入Customer.java

```
public class Consumer {
1.
2.
          /**
          * 当前例子是PushConsumer用法,使用方式给用户感觉是消息从RocketMQ服务器推到了应用客户端。<br/>br>
3.
          * 但是实际PushConsumer内部是使用长轮询Pull方式从MetaQ服务器拉消息,然后再回调用户Listener方法
 4.
      <br>
 5.
6.
         public static void main(String[] args) throws InterruptedException,
 7.
                           MQClientException{
8.
9.
                   * 一个应用创建一个Consumer,由应用来维护此对象,可以设置为全局对象或者单例<br>
                    * 注意: ConsumerGroupName需要由应用来保证唯一
10.
                    */
11.
                  DefaultMQPushConsumer consumer = new DefaultMQPushConsumer(
12.
13.
                                   "ConsumerGroupName");
14.
                   consumer.setNamesrvAddr("127.0.0.1:9876");
                   consumer.setInstanceName("Consumber");
15.
16.
17.
                   * 订阅指定topic下tags分别等于TagA或TagC或TagD
                   */
19.
20.
                   consumer.subscribe("TopicTest1","TagA || TagC || TagD");
21.
                   * 订阅指定topic下所有消息<br>
22.
                    * 注意: 一个consumer对象可以订阅多个topic
23.
24.
25.
                   consumer.subscribe("TopicTest2","*");
26.
27.
                   consumer.registerMessageListener(new MessageListenerConcurrently() {
28.
29.
                           public ConsumeConcurrentlyStatus consumeMessage(
30.
                                            List<MessageExt>msgs, ConsumeConcurrentlyContext context)
```

```
31
  32.
                                        System.out.println(Thread.currentThread().getName()
  33.
                                                           +" Receive New Messages: " + msgs.size());
  34.
  35.
                                        MessageExt msg = msgs.get(0);
  36.
                                        if(msg.getTopic().equals("TopicTest1")) {
                                                  //执行TopicTest1的消费逻辑
  37.
  38.
                                                  if(msg.getTags() != null && msg.getTags().equals("TagA"))
         {
  39.
                                                           //执行TagA的消费
  40.
                                                           System.out.println(new String(msg.getBody()));
                                                  }else if (msg.getTags() != null
  41.
  42.
                                                                    &&msg.getTags().equals("TagC")) {
  43.
                                                           //执行TagC的消费
  44.
                                                           System.out.println(new String(msg.getBody()));
  45.
                                                  }else if (msg.getTags() != null
  46.
                                                                    &&msg.getTags().equals("TagD")) {
  47.
                                                           //执行TagD的消费
  48.
                                                           System.out.println(new String(msg.getBody()));
  49.
                                        }else if (msg.getTopic().equals("TopicTest2")) {
  50.
                                                  System.out.println(new String(msg.getBody()));
  51.
  52.
                                        }
  53.
  54.

[▲] 你好,运行start mqnamesrv时出现windows版本不兼容怎么办?我的是win7 64位。

#2楼 2015-12-30 11:54 小野人~kobe

【↓ 请问在

进入刚生成的target文件夹下的bin目录,在命令行中执行: start mqnamesrv.exe, 会弹出一个信息窗口

这一步中 bin目录下并没有mqnamesrv.exe 只有mqnamesrv, 我将其改

为.exe 但是报错 说不支持64位win7系统,这应该怎么办?

还有我在淘宝上看到

开放消息服务ONS(Open Notification Service)是基于阿里开源消息中间件MetaQ(RocketMQ)

目前支持Java,C++,.NET, PHP四种语言,Linux平台下支持C++,JAVA和PHP三种语言,Windows平台支持C++和.NET两种语言。Windows不支持java,怎么用java测试?在windows系统中
